

Perl vs Python

Martyn Smith

Questions?

perl is easier to type

and so is pii

Documentation

- ❖ Perl has CPAN
- ❖ Python has ... I'm not really sure.

Modules

- ❖ Perl has CPAN
- ❖ Python has pip and easy_install
- ❖ Python has a much bigger core
- ❖ Some of Python's core is a bit dumb

DateTime

- ❖ Perl has many modules, but I tend to use DateTime (it's not core)
- ❖ Python has datetime (it's core)
- ❖ `datetime.now()` vs `datetime.utcnow()`
- ❖ Naive datetime objects

Scoping/Classes

Perl

```
package Martyn;

use Moose;

has 'wearing' => ( isa => 'Str' );

sub get_dressed {
    my ($self) = @_;

    $self->wearing('pants');
}

sub scope_example {
    my $a = 'pants'; # local var
    if ( 1 ) {
        my $a = 'other pants'; # "more" local var
    }
    say $a; # "pants"
}
```

Python

```
class Martyn(object):
    wearing = None

    def get_dressed(self):
        self.wearing = 'pants'

    def scope_example(self):
        a = 'pants'

        if True:
            a = 'other pants'

        print a # "other pants"
```

Map/Grep and data

Perl

```
sub munge {  
    my ($data, $filter_field, $search) = @_;  
  
    my @matches =  
        grep { $_->{$filter_field} ~~ $search }  
            @{$data};  
;  
  
    return map {  
        $_->{first} . ' ' . $_->{last}  
    } @matches;  
}
```

Python

```
def munge(data, filter_field, search):  
    matches = [  
        x for x in data  
        if x[filter_field] == search  
    ]  
  
    return [  
        "%s %s" % (x['first'], x['last'])  
        for x in matches  
    ]  
  
    # or  
  
    return [  
        "%(first)s %(last)s" % x  
        for x in matches  
    ]
```

Exceptions

Perl

use some random module from CPAN that the author of the 3rd party module you're using **didn't** use, so if you want to catch his exceptions you're screwed!

Python

```
def attempt_stuff():  
    try:  
        do_something()  
    except DidntWork, e:  
        # deal with it  
    except IOError:  
        # something different  
    except:  
        # all other exceptions
```

Anonymous subs

Perl

```
my $sub = sub { more_munge(munge($_[0])) };

my $sub = sub {
    my ($in) = @_;

    $in = munge($in);
    $in = more_munge($in);
    return $in;
};
```

Python

```
sub = lambda x: more_munge(munge(x))

def temp_name(x):
    x = munge(x)
    x = more_munge(x)
    return x

sub = temp_name
```

Importing

Perl

```
use MyProject::Model::MyClass;  
  
$a = MyProject::Model::MyClass->new(@args);  
  
if ( $a->isa('MyProject::Model::MyClass') ) {  
    do_stuff()  
}
```

Python

```
from myproject.model import MyClass  
  
a = MyClass(args)  
  
if isinstance(a, MyClass):  
    do_stuff()
```

```
File "/home/martyn/src/bayer/bayer/templates/base.jinja2", line 80, in top-level template code
```

```
{%- block content -%}{%- endblock %}
```

```
File "/home/martyn/src/bayer/bayer/templates/directory/index.jinja2", line 14, in block "content"
```

```
<a href="{{ url_for('.view_user', user_id=kol.id) }}"></a>
```

```
[console ready]
```

```
>>> kol.id
```

```
ObjectId('504e55e8b43b1c3ab35c1c7f')
```

```
>>> kol.profile_image
```

```
